

HCOB Network — Admin Training Manual

Audience: Admins, Program Managers, and the Owner Portal: `/ops` (log in at `/login` with an admin account) Last updated: June 2026

1. Getting Started

1.1 Logging in

1. Go to `/login` and enter your admin email and password (or use Continue with Google if your account was created that way).
2. You land on the Dashboard (`/ops`).
3. If you forget your password, use Forgot password on the login page. The Owner can also reset any user's password from their detail page.

1.2 Admin roles

Role	What it adds
Admin	Full access to assignments, workers, blasts, reports, projects, and the VA program review tools.
Program Manager (PM)	An admin flagged as PM — primary reviewer of VA leads and commissions.
Owner	Everything above, plus: final commission sign-off, Payouts page, mark-paid, the Blast Kill Switch, and resetting any user's password.

1.3 The sidebar

The left sidebar is organized into collapsible groups. Amber/blue count badges show items waiting for you:

- Dashboard and Calendar (always visible at top)
- Work Pipeline — Requests · Quotes · Assignments · AI Assignment · Projects
- People — Workers · Certifications · Trades · Referrals · Messages
- Growth — Blast · SMS Consent · Service Catalog · Announcements · Reports
- Finance — Bookkeeping · Worker Pay · Payouts (Owner only)
- VA Program — Overview · Applications · Lead Pipeline · Digital Services · Digital Jobs · Rates · Teams · Commissions · VA Accounts · Commercial
- Settings

1.4 The notification bell

The bell in the top bar shows in-app notifications (new requests, quote submissions, VA events, messages). Click any notification to jump straight to the relevant page.

2. Dashboard & Calendar

2.1 Dashboard (</ops>)

Your daily command center: - KPI cards — open assignments, pending requests, workers, and more. - Pending requests strip (yellow) — "X requests waiting for your approval → REVIEW NOW" links to the Requests queue. - Available Now strip (green) — "X workers are available right now" — perfect for filling RUSH assignments fast.

2.2 Calendar (</ops/calendar>)

Three views (toggle top-right): Month / Week / Day. - Month — heatmap-tinted grid (bluer = lighter day, redder = busier); each day shows pay/hours/slots mini-stats. - Week — 7 columns with stacked assignment cards. - Day — hour-by-hour timeline with KPIs and an "At a glance" roster panel. - Click an empty day to create an assignment pre-set to that date. Click a chip to open the assignment. - Times always show the wall-clock time you entered — no timezone drift for you or the workers.

3. Work Pipeline

3.1 Requests (</ops/requests>)

The global queue of every pending worker request across all assignments, oldest first. - Approve — reserves the slot, notifies the worker, and reveals the full address to them. - Reject — removes the request and notifies the worker. - Important: a request does not hold a slot. Multiple workers can request the same slot; you pick.

3.2 Quotes (</ops/quotes>)

Customer quote requests submitted from the public site. Review details and follow up with the customer directly.

3.3 Assignments (</ops/assignments>)

The full list of assignments (gigs), with sortable columns (Title, Category, When, Pay, Slots, Status, Blasts) and status filters.

Creating an assignment (the "+ New" button or from the Calendar): - Title, category, description — descriptions support Markdown (bold, lists, links) with a Write/Preview editor. - Location vs. Address line — **Location** (street + zip) is public; **Address line** is the sensitive full address, shown to a worker only after you approve them. - Date & time, slots, backup slots — backups queue behind the main roster and auto-promote if someone cancels. - Pay — hourly or flat rate; Break (min) deducts unpaid break time from hourly pay. - Payment timeline — Same day / 2-3 days (default) / Weekly / Custom (with a note). Workers see this as a colored pill. - Recurring — daily / weekly / biweekly / monthly, up to 52 occurrences, generated as a linked series. - Best-fit workers panel — suggests workers whose trades/skills match the category as you type. - Templates — start from a saved posting template to pre-fill everything.

On the assignment detail page you can: - Edit / Duplicate the assignment. - Pin tags — RUSH · PRIORITY NEED · SAME DAY · TOP PAY. Any tag pins the card to the top of the worker feed with a colored border. - Blast it (see §5.1) — blasting auto-sets the RUSH tag. - Review pending requests — Approve / Approve as backup / Reject per row. - Add a worker

directly (skips the request step) or Remove someone (releases the slot, notifies them). - Roster & time tracking — see clock-in/out per worker, edit timesheets, apply pay overrides, approve timesheets (workers only see earnings after approval). - Share link — copies a link that unfurls with a branded preview card in iMessage/WhatsApp/Facebook. - Open gig group chat — the per-assignment group thread with all approved workers.

3.4 AI Assignment (</ops/ai-assignment>)

Describe the job in plain English and the AI drafts a complete assignment (title, description, category, pay suggestion) for you to review, tweak, and post.

3.5 Projects (</ops/projects>)

A Project bundles related assignments that share one job site (e.g. driver + handyman + crew lead). - Create a project with defaults (location, date, payment timeline, contact) that can sync into linked assignments. - Link/unlink assignments from the project or the assignment page. - See the combined crew across all linked assignments, keep an admin-only notes thread, and blast the whole project at once. - Archiving a project unlinks its assignments but never deletes them.

4. People

4.1 Workers (</ops/workers>)

Search and filter the roster: status tabs, skills, availability, zip, vehicle, profile completion, and the Available Now toggle (workers who flipped their green "available" pill get a pulsing badge).

Worker detail page (</ops/workers/:id>) — everything about one worker: - Documents — view and Verify ID, Verify W-9, Verify signed agreement. Workers cannot claim assignments until their ID is verified. - Account actions — Approve / Reject / Suspend / Reinstate (reject and suspend kill their sessions immediately), reset password (temp password shown once), delete (cascades and releases their slots). - Profile override — edit any profile field on the worker's behalf (skills, contact, status, email). - Pay defaults — set the worker's default rate; per-assignment overrides are set on the assignment page. - Ratings & activity — star ratings and their requested/approved/completed/no-show history. - Message worker — one click opens a DM.

Tip: Worker names are clickable everywhere in the admin portal (rosters, reports, queues) and open the worker's page in a new tab.

4.2 Certifications (</ops/badges>)

Manage the professional certified badge catalog and award badges to workers. Badges show on worker profiles.

4.3 Trades (</ops/trades>)

Manage the worker trade taxonomy (the categories/specialties workers pick at signup). This powers best-fit matching and specialist targeting.

4.4 Referrals (</ops/referrals>)

The contractor referral program: track client referrals submitted by workers and manage their reward status.

4.5 Messages (</ops/messages>)

Full inbox: DMs and per-assignment group chats. - Quick template chips (Available? · ID reminder · Shift soon · Late · Thanks) auto-fill with the recipient's name. - Email / SMS companion toggles — send a DM and simultaneously deliver it by email and/or text (DMs only, never group chats). - Unread badge polls automatically; recipients also get an email digest if a message sits unread for 15+ minutes.

5. Growth

5.1 Blast (</ops/email-blast>)

The unified mass-messaging composer — Email and SMS in one send. 1. Pick channels (Email / SMS / in-app) — you can send any combination. 2. Write the email subject/body and/or the SMS text. The SMS composer shows a live character & segment counter — stay under 160 GSM-7 characters for a single segment, and use plain hyphens (-), never em-dashes. 3. Or click Start from template to pre-fill both email and SMS bodies. 4. Send. In-app notifications go instantly; email/SMS deliver in the background — the toast confirms "queued".

SMS compliance is automatic: the "Reply STOP to opt out" footer is appended server-side, and texts only go to workers who opted in.

Safety systems (built-in, always on): - Cooldown — re-blasting the same assignment/project within 5 minutes is blocked (429 "wait Xs"). - Deduplication — duplicate emails/phones are collapsed before sending; a retried blast never re-mails an address. - Kill Switch — the Owner can disable ALL blasts platform-wide from Settings in one click (see §8). - Blast audit — every send is logged with counts, failures, and sender name (see Reports → Blasts).

5.2 SMS Consent (</ops/sms-consent>)

The compliance audit log: who opted in to texts, when, and from where (profile toggle, feed nudge, admin). Export to CSV for carrier/Twilio audits. Workers self-manage opt-in from their profile.

5.3 Service Catalog (</ops/services>)

Manage the VA service catalog — the digital services (and rates) that VAs can be hired for.

5.4 Announcements (</ops/announcements>)

Post platform-wide announcements that appear in worker portals.

5.5 Reports (</ops/reports>)

Every report supports date filters, CSV download, and Google Sheets export: - Timesheets — per-worker clock-in/out, break minutes, paid hours, earnings; approve state included. - Earnings / Payroll — one row per worker with totals. - Workers / Roster — full roster export with an optional PII toggle. - Gigs — assignments with fill rates and payout per

assignment. - Activity — requested / approved / completed / no-shows per worker. - Blasts — every blast ever sent: channels, targets, delivered, failed, sender.

6. Finance

6.1 Bookkeeping ([/ops/bookkeeping](#))

Ledger view of platform money movement — payroll logs and commission entries.

6.2 Worker Pay ([/ops/worker-pay](#))

Central pay administration: default rates, per-assignment overrides, and payout review.

The timesheet approval flow (important): 1. Worker clocks in/out on their phone → hours computed automatically (breaks deducted for hourly pay). 2. You review on the assignment page — edit clock times or break override if needed. 3.

Approve timesheet → only then does the worker see their earnings.

6.3 Payouts ([/ops/payouts](#)) — Owner only

The final gate for VA commission payouts: - Queue of PM-approved commissions awaiting sign-off. - Approve individually or bulk-approve per VA per week. - Mark paid (records method + reference). A paid commission is frozen — double-payment is blocked at the database layer.

7. VA Program

The VA program lets Virtual Assistants submit cleaning-lead prospects and earn commissions through a controlled review chain: VA submits → PM reviews → Owner signs off → paid.

Page	What you do there
VA Overview	Program KPIs + "Open detailed analytics →" (velocity chart, per-VA conversion funnel, stuck-lead leak report).
Applications	Approve or reject new VA signups. Pending VAs cannot submit leads.
Lead Pipeline	Kanban of all leads through 7 stages (New → Contacted → Quoted → Booked → Paid → Completed/Lost). Advance stages, edit any lead, soft-delete to Trash (restorable), full audit trail per lead.
Digital Services / Digital Jobs	Manage the VA digital-services catalog and job postings.
Rates	Commission rate configuration. Defaults: routine \$10, recurring V1 \$15 / V2 \$25 / V3-6 \$10 (cap \$100/client), deep/move-out/specialty \$25 flat, commercial 5% of monthly revenue.
Teams	2-level VA team structure with leader override commissions.
Commissions	PM review queue — Approve / Flag (note required) / Reject each commission.
VA Accounts	Manage VA users: approve, suspend (kills sessions), remove.
Commercial	Recurring commercial accounts earning 5% monthly commission.

Built-in fraud safeguards (automatic, logged as violations): duplicate-lead blocking (same phone/email), self-referral blocking (prospect address matches the VA's own), ownership timestamp locks, and the double-payment freeze.

Commission lifecycle: Lead reaches Booked → commission created → lead reaches Paid (with job value) → enters the PM queue → PM approves → Owner signs off → Owner marks paid → VA is notified.

8. Settings (</ops/settings>)

- Email (Resend) & SMS (Twilio) credentials — enter/update API keys; secrets are masked after saving (only the last 4 characters show). Status cards flip between READY / NOT CONFIGURED so you always know which blast channels will actually deliver. Use the Test button to dry-run a real email or SMS.
- Blast Kill Switch (Owner) — the big red "Disable all blasts" button. When ON, every blast attempt platform-wide returns an error and any in-flight background sends stop. Shows who toggled it and when. Use it the moment anything looks wrong with outbound messaging.
- Change password — self-service for your own account.
- Admin users — add admins, set read-only roles, promote/demote (Owner controls).

9. Common Workflows (Cheat Sheet)

Post and fill an assignment

1. Assignments → + New (or click a calendar day). Fill in details, set slots + backups, pick payment timeline. Save.
2. Blast it from the assignment page (this pins it as RUSH) or add pin tags manually.

3. Watch Requests — approve the workers you want, reject the rest. Approved workers see the full address and can clock in.
4. After the job: review clock-in/out, edit if needed, Approve timesheet → worker sees earnings.

Onboard a new worker

1. Worker registers, completes the trade questionnaire, uploads ID (+ W-9 and signed agreement from their profile).
2. Open their page from Workers → verify ID, verify W-9, verify agreement.
3. Once ID-verified, they can request assignments. Set their default pay under Pay defaults if it differs from standard.

Send a text + email campaign

1. Growth → Blast. Toggle Email and SMS on.
2. Start from a template or write fresh — keep SMS ≤ 160 characters, one segment.
3. Send. Check Reports → Blasts later for delivered/failed counts.

Pay a VA commission (Owner)

1. PM approves the commission in VA Program → Commissions.
2. Owner opens Finance → Payouts, signs off (or bulk-approves), then Mark paid with method + reference.

Emergency: stop all outbound messages

Settings → Blast Kill Switch → Disable all blasts. Effective immediately, platform-wide, reversible with one click.

10. Quick Reference

I need to...	Go to
Approve worker requests	Work Pipeline → Requests
Create/edit an assignment	Work Pipeline → Assignments
Draft an assignment with AI	Work Pipeline → AI Assignment
Verify an ID / W-9 / agreement	People → Workers → worker page
Text or email everyone	Growth → Blast
Check who opted in to SMS	Growth → SMS Consent
Run payroll	Growth → Reports → Earnings / Timesheets
Approve VA commissions	VA Program → Commissions
Pay out commissions (Owner)	Finance → Payouts
Stop all blasts NOW (Owner)	Settings → Blast Kill Switch
Update email/SMS API keys	Settings
